PROFESSIONAL SUMMARY

Full Stack and mobile app Software Engineer with hands-on experience designing and delivering production-grade web applications, SaaS platforms, and business automation systems. Specializes in end-to-end development across the MERN stack and Django, with a track record of architecting multi-tenant SaaS products, building RESTful APIs consumed by thousands of requests, and integrating AI-driven workflows that measurably reduce manual overhead. Approaches every project from the architecture down - structuring scalable databases, enforcing role-based security, and shipping features that solve real operational problems for real users.

PROFESSIONAL EXPERIENCE

Independent / Remote Clients

Freelance Full Stack Software Engineer

01/2024 – 12/2026

- Delivered 10+ production web applications across property management, inventory, rental, education, and services sectors, handling both client communication and technical execution end-to-end.
- Architected multi-tenant SaaS systems with complete tenant isolation, role-based permissions, and scalable backend APIs serving concurrent user bases.
- Designed and optimized relational and NoSQL database schemas (MySQL, MongoDB) for applications handling complex entity relationships and high-frequency write operations.
- Integrated AI-powered workflows into SaaS products, including intelligent form auto-fill and data extraction features that eliminated repetitive manual entry for end users.
- Automated business processes - maintenance routing, inventory reorder triggers, booking conflict detection - reducing operational overhead without adding headcount.
- Collaborated directly with business stakeholders to translate domain requirements into technical specifications, then delivered tested, documented, and deployed solutions.

EDUCATION

Bachelor of Science in Information Science

Jimma University, Ethiopia

alx Django developer

TECHNICAL SKILLS

Frontend

React.js, JavaScript (ES6+), HTML5, CSS3, Tailwind CSS, Vite, Responsive Design

Backend

Node.js, Express.js, Django, Python, RESTful API Design

Database

MongoDB, MySQL, Prisma ORM, Schema Design, Query Optimization

Auth & Security

JWT, Role-Based Access Control (RBAC), Session Management, OAuth concepts

AI & Automation

OpenAI API Integration, AI-Assisted Workflows, Intelligent Data Extraction, Business Process Automation

DevOps & Tools

Git, GitHub, Docker, Postman, Linux, VS Code

ADDITIONAL PROJECTS

School Management System

MERN Stack

Automates enrollment, class scheduling, grade tracking, and staff management for educational institutions.

Exam Bank System

React.js / Node.js / MySQL

Centralized repository for exam questions with tagging, filtering, and randomized paper generation.

Course Management System

MERN Stack

Manages course catalogs, instructor assignments, enrollment workflows, and learner progress tracking.

Garage Management System

Django / Python

Tracks vehicle service history, job cards, parts inventory, and technician assignments for auto-repair businesses.

Family Registration System

MERN Stack

Structured civil registration platform for recording family units, relationships, and documentation status.

Locality Registration System

React.js / Node.js / MySQL

Geographic data management system for registering and querying locality-level demographic records.

AI INTEGRATION & AUTOMATION

Beyond conventional development, applies AI capabilities to solve practical business problems at the application layer:

- Integrated OpenAI API into a SaaS platform to power intelligent form pre-population: the system extracts structured data from unstructured user-submitted documents, reducing a multi-minute manual entry task to under 10 seconds per record.
- Built automated data extraction pipelines using Python and Django that classify, normalize, and store scraped data - replacing analyst hours with scheduled, AI-assisted processing.
- Applied AI-assisted development practices (code generation, automated test scaffolding, intelligent refactoring) to accelerate delivery timelines on client projects.
- Designed workflow automation layers that trigger actions based on data state changes, replacing manual monitoring with event-driven processes across inventory and property management systems.

KEY ACHIEVEMENTS

- Shipped 5 full-featured SaaS and management platforms from concept to production deployment, each serving multiple user roles with distinct permission boundaries.
- Reduced a client's manual inventory reconciliation cycle from weekly audits to real-time automated tracking, eliminating a recurring 4-hour administrative task.
- Designed multi-tenant architecture patterns that allow a single deployed codebase to serve independent businesses with zero data bleed between accounts.
- Built AI-assisted data extraction workflow cutting manual data entry effort by ~70% in a document-heavy SaaS workflow.
- Maintained clean, documented codebases across all projects, enabling seamless handoff and ongoing maintenance without tribal knowledge dependencies.

FEATURED PROJECTS

SaaS Property Management System (PMS)

React.js, Node.js, Express.js, MySQL, JWT, AI Integration

- Architected a multi-tenant SaaS platform enabling property managers to oversee properties, tenants, maintenance requests, and payments from a unified dashboard.
- Implemented granular role-based access control (RBAC) separating landlord, property manager, tenant, and admin contexts - eliminating unauthorized data access across tenants.
- Designed automated notification and workflow engine that reduced manual follow-up on maintenance tickets by routing assignments and escalations without human intervention.
- Built a reporting dashboard aggregating occupancy rates, payment histories, and maintenance KPIs, giving property managers instant operational visibility.

StockWise

SaaS Inventory & Stock Management Platform, MERN Stack, MySQL

- Developed a multi-user SaaS inventory platform with real-time stock tracking, low-stock alerts, supplier management, and sales reporting for small-to-mid-size businesses.
- Designed a normalized relational schema supporting concurrent access by multiple business tenants while maintaining complete data isolation.
- Delivered a role-differentiated UI allowing warehouse staff, managers, and owners to access only the data and actions relevant to their responsibilities.
- Reduced inventory discrepancy incidents by automating reorder triggers and audit trail logging on all stock movements.

Car Rental Management System

React.js, Node.js, Express.js, MySQL

- Built end-to-end vehicle rental platform covering the full customer lifecycle: vehicle browse, reservation, contract generation, payment tracking, and return processing.
- Engineered a real-time availability engine preventing double-bookings across the vehicle fleet and surfacing calendar conflicts before checkout.
- Created an administrative dashboard consolidating fleet utilization, outstanding payments, and upcoming reservations for operations staff.

AI-Powered Data Scraping & Processing System

Python, Django, REST APIs

- Built automated pipelines to collect, clean, and transform large datasets from multiple online sources, feeding structured outputs into downstream business intelligence tools.

- Integrated AI-assisted extraction logic that classified and normalized unstructured source data, cutting manual data-cleaning effort by an estimated 70%.
- Designed fault-tolerant scheduler with retry logic and logging to ensure pipeline reliability even when source structure or availability changed.

Home Cleaners Service Marketplace

MERN Stack

- Developed a full-featured service marketplace connecting customers with cleaning professionals through a booking flow, availability management, and payment workflow.
- Built scheduling engine handling service windows, provider availability, and customer rescheduling - reducing booking conflicts and missed appointments.
- Delivered admin dashboard for platform operators to manage providers, resolve disputes, and monitor service completion rates.
